

* Head and Tail Functions :->

Head and Tail functions are special functions which are used to fetch n number of rows from top and bottom respectively,

```
print(df.head(n))
```

no. of rows to be
fetched.

```
print(df.tail(n))
```

Note:-> When the value of n is not provided, default value of n is 5. So, 5 rows are fetched from top and bottom with head and tail functions respectively.

```
print(df.head())
```

```
print(df.tail())
```
