

The data / numeric data count associated with every row / value in a series is called as its index. By default, it starts from zero (0) but it can be manipulated / changed.

* Accessing elements of a Series :->

(i) Indexing :-> Indexing is the method / way in which value of series is accessed with the help of index.

Default integer index that starts from 0.

User-defined index or labels.

Syntax :-> `print (ser_name [index])` (single value)
`print (ser_name [i1, i2])` (multiple value)
