* Data Accessing by Indexing :→

Boolean means a binary variable that can represent either of two states - True (1) or False (0).

In Boolean Indexing, we filter the data by True or False. On the basis of condition, the result is printed.

Eg. To check in which subjects, 'Aman' has scored > 90.

```
print(df.loc['Aman'] > 90)
```

Maths	True
English	False
Hindi	True

Name: Aman, dtype: bool
